

Configure Proxychains

Your going to need the Tor service for this. Do you have it? lets check

```
service tor status
```

If you do have it, skip this and go to the next part. If not, installing. Do this

```
sudo apt-get install tor
```

Here is where your configuration file is hiding. Edit it with whatever you use to edit stuff with.

```
vim /etc/proxychains.conf
```

Once your in, do this

1. Remove "dynamic_chain" from comment

```
# proxychains.conf  VER 3.1
#
#       HTTP, SOCKS4, SOCKS5 tunneling proxifier with DNS.
#
# The option below identifies how the ProxyList is treated.
# only one option should be uncommented at time,
# otherwise the last appearing option will be accepted
#
dynamic_chain
#
# Dynamic - Each connection will be done via chained proxies
# all proxies chained in the order as they appear in the list
# at least one proxy must be online to play in chain
# (dead proxies are skipped)
# otherwise EINTR is returned to the app
```

2. comment out 'strict_chain" and Random chain

```
#
#strict_chain
#
```

3. Comment out 'proxy_dns'

```
# Proxy DNS requests - no leak for DNS data
#proxy_dns
```

4. Last like in "ProxyList" type in 'socks5 127.0.0.1 9050' in last line of proxy list

```
[ProxyList]  
# add proxy here ...  
# meanwhile  
# defaults set to "tor"  
socks4 127.0.0.1 9050
```
